Description

A complete course to help anyone with basic SQL skills learn advanced dbt, a key tool for Analytics Engineering!

Welcome to the **2025 Mastering dbt (data build tool)** course! This course runs through everything from the theory behind dbt to building an advanced dbt project (**from scratch**) and deploying it on dbt Cloud.

I have over 9 years of experience across Analytics / Analytics Engineering / Data Science, including 5 years using dbt on a daily basis. I was also involved in the rollout of dbt in my time at Monzo Bank!

In this course I've taken everything I've learnt over the past 5 years, and what I use on a daily basis, and condensed it to take anyone who knows SQL to an advanced level of dbt as quickly as possible.

MY APPROACH TO THIS COURSE:

We'll cover everything you need to know about dbt: from the basic data modelling right through to all of the advanced features such as creating custom tests and macros. We'll be doing this step by step, and **build from the basics upwards**.

It's focused on **practical outcomes** - we won't be spending ages on database theory, or going into lots of detail on the eCommerce dataset we'll be using, instead we'll be aiming to get you up to advanced dbt levels as quickly as possible.

For every video where we're writing code, I've created lesson attachments with the final outputs. This means you can either code as you go along, or watch the videos and look at the handouts afterwards! I've also included some theory with these handouts to help hammer home the points made in the videos.

There's also a public GitHub repository (which you'll be using for this course) that contains a model final project you can reference throughout.

This course isn't static! I'd love to hear your feedback and will be updating this course on an ongoing basis.

COURSE STRUCTURE:

This course focuses on first getting a good understanding of what problems dbt solves. then
